

User Story 1.1: Baseline Spend Visibility from Oracle AP

As a Sourcing Associate, I want to see total GNFR spend by supplier, category, and location (division, manufacturing plant, distribution center level) even when a transaction only exists in Oracle AP, so I have a baseline view across all spend regardless of source system.

Description:

Deliver a baseline spend view that draws from Oracle AP as the foundational data source, ensuring 100% of GNFR spend is visible even when a transaction has no corresponding Coupa or EAA record.

Narrative:

Today, spend visibility is fragmented across systems, with Coupa capturing only a subset of total GNFR spend. Sourcing Associates need a single starting point that reflects the complete picture, not just the portion that happens to be well-documented in Coupa. Oracle AP, as the base layer covering all GNFR spend, closes that gap.

Business Value:

Eliminates blind spots in spend visibility - associates no longer need to assume that unrepresented spend simply doesn't exist. Supports the \$90M savings target by ensuring the full addressable spend base is visible, not just the ~\$1B previously analyzed via Coupa alone.

Acceptance Criteria:

- Given a GNFR transaction exists only in Oracle AP, when a user views spend by supplier, category, or location, then that transaction is included in the total
- When queried, Oracle AP spend totals and data reconcile against source system records
- Location drill-down supports division, manufacturing plant, and distribution center levels at minimum

Out of Scope:

- Site/store-level granularity below division (flagged as a known gap from Aug 12 Sourcing Associate feedback - Epic doesn't currently support this, and Oracle AP location data only goes to division level)
- Coupa/EAA enrichment of these records (covered in Story 1.2)
- Equivalent Bronze/Silver/Gold object map for Oracle AP itself - stated open dependency, not yet documented
