

User Story 2.1: [TBD] Default Categorization Taxonomy

As a Data/AI Engineer, I want spend categorized against a confirmed default taxonomy [Coupa commodity hierarchy vs. new business-provided taxonomy - TBD], so category is available consistently across all Coupa-sourced spend.

Status: Placeholder - pending resolution. Original approach assumed Coupa commodity hierarchy as MVP source of truth. This is no longer settled - business may provide a new taxonomy (based on Epic's mid-level/desk structure) that could replace Coupa for one or more categories at MVP. Do not build against this story until finalized (target: 8/21 per current roadmap).

Description:

Apply a confirmed default categorization taxonomy for MVP, ensuring every Coupa-sourced spend record has a consistent, baseline category assignment. **Which taxonomy serves as that default is currently open**, pending the categorization approach discussion in progress.

Narrative:

With multiple potential categorization signals under evaluation (Coupa hierarchy, new business taxonomy, GL description, OCR detail, Supplier Hub codes), the team needs a stable default to build against. This was previously assumed to be Coupa's commodity hierarchy, but that assumption is now in question.

Business Value:

Ensures Sourcing Automation, Invoice Leakage, and Spend Visibility all have a usable category dimension to build against. *Value framing may shift depending on which taxonomy is confirmed - to be revisited.*

Acceptance Criteria:

- **TBD pending taxonomy decision** - draft placeholders below, subject to change:
 - Given a spend record originates from Coupa, when categorized, then it is assigned a category based on [confirmed taxonomy]
 - Given the confirmed taxonomy is updated, when spend is recategorized, then the change is reflected without requiring a redeploy
 - Category assignment is available as a filter/drill-down dimension in Spend Visibility

Out of Scope:

- Categorization of Oracle AP-only or EAA-only spend, where no mapping exists yet (open regardless of which taxonomy is chosen)

- Incorporating GL description, OCR, or Supplier Hub signals (covered in Story 2.3)
- Full business-preferred taxonomy rollout across all categories - tracked under the Business Category Taxonomy Mapping workstream; this story concerns only the MVP default, not the phased full rollout
