

User Story 1.3: Source Precedence Rule for Conflicting Spend Detail

As a Data/AI Engineer, I want a defined precedence rule (source system detail overrides Oracle AP where both exist) so spend isn't double-counted or contradicted across sources.

Description:

Establish and apply a consistent precedence rule for reconciling spend data when the same transaction exists in both Oracle AP and a source system (Coupa or EAA), ensuring source system detail takes priority over the Oracle AP baseline, so figures don't conflict or double-count across the two.

Narrative:

Since Oracle AP serves as the baseline layer while Coupa and EAA enrich it, there's an inherent risk of the same transaction being represented differently (or twice) across sources. Without a defined rule for which source "wins" when values disagree, spend totals could be inconsistent, undermining trust in the numbers associates rely on to make decisions.

Business Value:

Protects the integrity of spend totals - without this rule, associates could see conflicting numbers for the same spend depending on which source they're looking at, or totals could be inflated through double-counting. This is foundational to every other capability that depends on accurate spend figures (Sourcing Automation, Invoice Leakage).

Acceptance Criteria:

- Given a transaction exists in both Oracle AP and a source system (Coupa or EAA), when spend totals are calculated, then the source system's value is used, not Oracle AP's
- Given a transaction exists in both Oracle AP and a source system, when displayed in the spend view, then it is counted once, not twice
- Given a conflict between Oracle AP and a source system, when the record is enriched, then the resolution (which source won) is auditable/traceable, not silently resolved

Open Question:

- Precedence rules between Coupa and EAA when both have conflicting detail for the same transaction

Out of Scope:

- Surfacing the conflict itself to end users as a trust/data-quality flag (covered in Epic 5)
