

User Story 2.3: Additional Categorization Signals (GL Description, Supplier Hub, NAICS)

As a Data/AI Engineer, I want access to the GL distribution table (not just the payments table), Supplier Hub category/subcategory and NAICS codes for a supplier, so line-item description can be used as a categorization signal.

Description:

Gain access to additional data sources beyond the default taxonomy (Story 2.1) - specifically the GL distribution table and Supplier Hub category/subcategory and NAICS codes - to use as supplementary categorization signals where the primary taxonomy match is weak or unavailable.

Narrative:

The default taxonomy alone won't confidently categorize all spend, particularly for Oracle AP-only transactions or cases where a Coupa/business taxonomy mapping doesn't cleanly apply. Additional signals (i.e., GL line-item description and Supplier Hub's category/subcategory and NAICS codes) were identified as candidates to close that gap.

Business Value:

Improves categorization coverage and accuracy for spend that doesn't map cleanly to the primary taxonomy, reducing the volume of low-confidence flags (Story 2.2) and strengthening the overall reliability of the categorization layer.

Acceptance Criteria:

- Given access to the GL distribution table is granted, when a spend record lacks a confident primary taxonomy match, then GL line-item description is available to inform categorization
- Given a supplier record exists in Supplier Hub, when categorizing spend from that supplier, then Supplier Hub category/subcategory and NAICS codes are available as a signal
- Given multiple signals are available for a single record, when categorization is determined, then the signal priority/hierarchy used is documented and auditable

Out of Scope:

- Actually securing access to the GL distribution table from Nick/Matt's team - this is a stated open dependency, not something this story can guarantee
- OCR-extracted invoice line-item detail as a signal (tracked as its own dependency, contingent on Document Digitization's progress)
- Supplier Hub self-selection data-quality issues (e.g. suppliers spanning multiple inconsistent codes, as raised in the Aug 12 Sourcing Associate session) - flagged as a known risk, not
