

User Story 3.1: Full Spend Population with Manual Filtering

As a Sourcing Associate, I want to see the full spend population by default and manually filter by category, supplier, and location, so I can focus on what's relevant without waiting for automated persona-based filtering.

Description:

Deliver a single shared spend view for all users at MVP, showing the full unrestricted spend population by default, with manual filtering by category, supplier, and location available to narrow the view.

Narrative:

Rather than building automated persona-based filtering (which requires a dataset tying users to categories that doesn't exist yet), MVP takes a simpler approach: everyone sees everything, and narrows the view themselves using category, supplier, and location as filter dimensions. This keeps the experience consistent across every user type - Sourcing Associate, COE, Executive Sponsor - and avoids blocking launch on a more complex access model that's explicitly scoped for post-MVP.

Business Value:

Unblocks MVP delivery without waiting on a persona/access data model that doesn't exist today. Ensures no user is unintentionally excluded from spend they need to see, since restrictive filtering isn't applied by default.

Acceptance Criteria:

- Given a user opens the spend view, when no filters are applied, then the full spend population across all categories is shown
- Given a user applies a filter by category, supplier, or location, when applied, then the view narrows to matching spend records only
- Given any user type (Sourcing Associate, COE, Executive Sponsor), when they access the tool, then they see the same underlying view and filter options - no default view differs by role

Out of Scope:

- Automated persona-based pre-filtering (e.g. auto-scoping a user to their assigned categories) - explicitly post-MVP
- Role-specific default/landing views (e.g. a CPO summary view vs. an associate view) - explicitly post-MVP

- Navigating from a filtered spend record to related contract or invoice records (covered in Story 3.2) - this story covers filtering the spend view itself, not traversing to other object types
- Saved/persistent filter preferences per user - not addressed in this story
